WAVE GENERATOR DISK DEFLECTED
MODE INVESTIGATION WITH REGARD TO
LARGE WAVE GEAR

Central-bore disk deflected mode theoretical estimate results are presented with regard to large wave gear disk wave generator load conditions. Stress state is represented through stress function which is satisfied to biharmonic equation. Biharmonic equation solving is gotten in cosine-series form. External load is represented in trigonometric series form for boundary problem statement. Equations set solving is determined in Kramer's form.

Key words: disk, tensor, stress, deformation, load, series.
